The Problem: Stateless Prompting

Every time you open a new chat with ChatGPT or Claude, it has no idea who you are. It doesn't know your brand voice, your pricing, your clients, or how your team operates. You either re-explain everything from scratch, or you get generic output that sounds like it could belong to anyone.

This is called stateless prompting. The model is capable. The context is missing.

Stateless prompting is the equivalent of hiring a genius with amnesia every single time. The talent is there. The institutional knowledge is not.

WITHOUT A SKILL GRAPH

Starts from zero, every time

- Re-explain your brand tone on every task
- AI guesses your pricing and process
- Generic output that needs heavy editing
- No memory of past clients or decisions

CURRENT STATE

WITH A SKILL GRAPH

Reads your business first, then acts

- Knows your voice, tone, and offer details
- Follows your actual onboarding process
- Output lands 80% done on the first pass
- Every session builds on the last

GOAL STATE

A skill graph does not require new software. It is a folder of plain text files that any AI model can read.

02

Your 5 Starter Files

A skill graph is a folder of markdown (.md) files. Each file covers one slice of your business. An **index.md** acts as the briefing document: the agent reads it first, then pulls the relevant files for the task at hand. Files link to each other so the agent builds compound understanding instead of reading in isolation.

- 1 **brand-voice.md**
Your tone, writing style, words you use, words you avoid. Include 3 real examples of copy that sounds right and 2 that don't.
- 2 **sops.md**
How you onboard a client, handle a revision, run a delivery. One process per section. Keep it factual, not aspirational.
- 3 **client-context.md**
Active clients, their industry, what you are building for them, where things stand. Updated as the engagement progresses.
- 4 **follow-up-sequences.md**
Your exact follow-up messages for cold leads, warm leads, and post-proposal. The templates the agent pulls when you need to reach out.
- 5 **offer-details.md**
What you sell, at what price, what is included, what is excluded. The reference file for any proposal or sales conversation.

At the top of each file, add one line: **Links: [[index]], [[brand-voice]]** (whichever files connect).
This is how the agent navigates the graph rather than treating each file as a standalone document.

03 + 04

Load It In + The Audit

A

Claude Projects

Create a new project. Upload all 5 files as project knowledge. Every chat inside that project inherits the full graph automatically, with no extra setup per session.

B

Claude Code

Point the agent at your skill folder. It reads files directly from your filesystem and can update them over time, so the graph compounds as you use it.

Self-Audit: Does Your AI Know Your Business?

Answer yes or no. Score 1 point per yes.

- Does your AI know your brand voice?
- Does your AI know your pricing?
- Does your AI know your onboarding process?

- Does your AI know your follow-up sequences?
- Does your AI know your active client context?
- Does your AI know your team SOPs?

Score under 4: your AI is starting from zero every session. The 5 files above fix this. If you want it built for you, book a free call at cal.com/sai-yashwanth/consultation or visit turilabs.in
